

INDEX

vdp Property Price Index

Q3. 2019

Property prices continue to rise despite fragile economy

Compared with the corresponding quarter the previous year:

Property market as a whole: **+5.9 %**

Housing: **+5.8 %**

Owner-occupied housing: + 6.0 %

Multi-family houses: + 5.6 %

Housing top 7 markets: **+3.6 %**

Owner-occupied housing: +3.4 %

Multi-family houses: +3.7 %

Commercial: **+5.9 %**

Office properties: +8.8 %

Retail properties: +0.1 %

Property prices continue to rise despite fragile economy

Market as a whole

With an increase of 5.9 % compared with the third quarter of 2018, the vdp property price index rose further despite a still weak German economy. This weakness, which is mainly due to lower export demand from other European countries, has thus not yet affected demand for properties. Households continue to benefit from the high employment rate and positive income trend of the past few years. At the same time, the European Central Bank stuck to its expansionary monetary policy, leading to lower borrowing rates following two years of sideways movement. As a result, private and institutional investors continue to focus on property as an asset class.

Housing market

Prices on the housing market increased by 5.8 % overall year on year, meaning that the rise in prices of German residential properties continues to slow. This declining momentum is clearly evident on the market for multi-family houses, which recorded the lowest increase for nearly three years at 5.6 %. In particular, the planned or implemented draft legislation to limit rent rises appears gradually to be having an impact: new lease rentals climbed by 4.4 % year on year. Nevertheless, multi-family houses remain attractive to investors as the shortage of alternative investment opportunities and the prospect of continuing high demand should keep prices stable in the medium term.

Prices on the market for owner-occupied housing rose by 6.1 % year on year. Prices of single-family houses and condominiums increased at almost identical rates of 6.0 % and 6.1 %

respectively. Demand for residential property remains stable thanks to a still healthy labour market coupled with tax incentives and the further decline in borrowing rates.

Top 7 housing market

Price growth momentum for residential properties in the top 7 cities continues to level out. Prices rose by 3.6 % compared with the same quarter of the previous year. In other words, we continue to observe growth, but at an ever slower pace. This is reflected, among other things, in the fact that the increase compared to the prior-year quarter has now been lower for the eighth time in succession.

This weakening momentum is particularly apparent on the market for multi-family houses, where prices rose by 3.7 %. New lease rentals rose by only 2.7 % year on year, which represents a fairly significant slowdown in price growth. Regulatory uncertainty surrounding the political debate, especially the discussion over the rent cap, fuels the belief that the price growth of previous quarters will not continue unchecked.

Prices for owner-occupied housing increased by 3.4 % in the top 7 cities. While this also signals lower momentum, the difference compared to the rate of growth over the last two years is not as marked as on the market for multi-family houses. Condominium prices rose by 3.3 % year on year and prices of single-family houses by 3.6 %. The smallest price increase compared to the same quarter of the previous year was for condominiums in Munich (2.3 %) and the largest in Berlin (4.9 %). Compared with the increase in new lease rentals (Berlin: +2.6 % on the

same quarter of the previous year), this reflects the widening gap between owner-occupied property prices and rents in the major urban areas.

Commercial property market

Prices on the commercial property market rose by 5.9 % overall, thus increasing slightly faster than those for residential property during the period under review. The office property market, where prices were up by 8.8 % on the same quarter of the previous year, continues to play a dominant role.

This market is being driven by continuing high demand for space, which appears undampened by the weak economy. This demand is accompanied by a tight supply, which is also evidenced by low vacancy rates. These factors combined to increase new lease rentals for office space by 6.8 % year on year. At the same time, office properties remain the focus of investor interest, with the result that the cap rate index fell by 1.8 %. However, the market appears to be gradually bottoming out.

The trend of the retail property market lags well behind that of other markets. This is partly because the retail sector is facing structural challenges, particularly the steadily growing market share of online retailers. This makes it harder to market space in cities, even if parts can be absorbed by restaurants, pharmacies and supermarkets. The result has been a sideways movement in retail property prices, which have remained almost unchanged compared to the previous year with a marginal increase of 0.1 %. Rents were also relatively stable compared to the previous year, increasing by 0.3 %.

Methodology

Data basis

German financial institutions participating in the transaction database provide transaction details from their real estate financing business for input into the database. The database has been maintained since 2004 and provides statistically evaluable information on actual real estate transactions. Data are captured by the participating institutions in the form of appraisals of market and mortgage lending values that are prepared in the course of their mortgage lending activities. Property valuations are determined within each financial institution by certified property valuers or specially trained bank personnel. In addition to purchase price and date of purchase, the appraisal includes information about the property's macro and micro location, its age, layout and other price-influencing variables. In the case of certain types of property, information is also collected with regard to rental agreements and the date they were concluded. Information used to derive market and mortgage lending values is ascertained partly from submitted documentation and partly by valuers working in accordance with codified procedures. Table 1 provides an overview of the variables most frequently applied in the specification of individual indices for various market segments.

Substantive definitions of individual variables are coordinated with financial institutions via the contractual relationship between them and the vdp. In addition, property valuation in Germany is subject to strict regulations, which ensure that the valuation processes of individual institutions are harmonised to the greatest extent

Table 1: Variables from the vdp's transaction database

| Variable | Scaling | Characteristics |
|----------------------|---------|---|
| Makrolage | Nominal | Landkreis oder kreisfreie Stadt in Deutschland |
| Micro location | Ordinal | Very good - good - average - moderate - poor - catastrophic |
| Living /usable space | Metric | Living or usable space m ² |
| Plot size | Metric | Plot size of property in m ² |
| Year built | Metric | Year property built |
| Layout | Ordinal | Very good - good - average - moderate - poor - catastrophic |
| Condition | Ordinal | Very good - good - average - moderate - poor - catastrophic |
| Saleability | Ordinal | Very good - good - average - moderate - poor - catastrophic |
| Sub-property type | Nominal | Division of market segment into sub-segments |
| Purchase price | Metric | Purchase price of property in Euros |
| Rent | Metric | Contractual rent of property in Euros per m ² |

possible, especially as a result of the Verordnung über die Grundsätze für die Ermittlung der Verkehrswerte von Grundstücken (Regulation on the Principles for Determining the Market Value of Property – abbreviated to ImmoWertV) and the Beleihungswertermittlungsverordnung (Regulation on the Determination of the Mortgage Lending Value – abbreviated to BelWertV). Because the purchase prices and significant price-influencing characteristics of individual properties are determined in a uniform manner and because they are input into a uniform database structure, it is possible to analyse the data with the help of complex statistical procedures.

Calculation

As a result of the distinct heterogeneity of real estate properties and in order to be able to measure pure price changes, it is necessary to take account of the varying quality of the

properties concerned when measuring prices. Various procedures exist which take explicit account of the differences in the quality of individual properties in order to be able to measure pure price changes.

All vdp real estate indices are calculated by making use of so-called hedonic models. The hedonic model is based on the idea that heterogeneous commodities can be described by reference to their characteristics. In other words, a commodity can be represented as the sum of its characteristics. With regard to real estate, this means that this set of attributes might include, for example, details of physical characteristics such as plot size, living area, year built and details as to the property's location. Each of these named attributes has a specific influence on the price of the property, but there is no market for the attributes themselves; they cannot be sold separately and therefore cannot be viewed

in isolation. It is possible, nonetheless, implicitly to determine the proportion of the overall price of the property which each individual attribute makes up by examining real estate supply and demand. Multivariate regression models are used for this purpose, helping to provide a statistical estimate of the marginal contribution of each attribute. It is assumed that the model incorporates all relevant attributes and that deviations occur simply by coincidence and are not indicative of any systematic structures.

Weighting

The overall index is the weighted arithmetical average of the various price indices for residential and commercial real estate. The weightings used correspond to the share of monetary turnover in the German real estate market constituted respectively by residential and commercial real estate. Based on details provided by valuer committees (Gutachterausschüsse), these averaged 75.6% and 24.4%, respectively, between 2007 and 2012.

The weights used correspond with the percentage share of households in Germany living in their own home. For the year 2011 this share stood at 50.7%. Accordingly, 49.3% lived in a rented dwelling. The weights were derived on the basis of the building and housing census conducted by the Federal Statistical Office in 2011. The price index for owner-occupied housing is calculated as a weighted arithmetic mean of the percentage of households living in their own single-family house or condominium. In 2011 these shares amounted to 79.7% for single-family houses and 20.3% for condominiums.

For the commercial property price index, the weightings attributable to the office property capital value index and the retail property capital value index

correspond to the proportion of loans in the accounts of Pfandbrief Banks that were granted to these two categories. The figures for office property and retail property amount to 60% and 40%, respectively.

Top 7 residential properties

The top 7 residential property indices are calculated analogously to the calculation for the vdp's nationwide property price indices. The indices are estimated separately for each of the cities on the basis of the transaction database. Then, the seven individual indices of the relevant market segment are aggregated according to the respective shares to form a top 7 index. For more information, please visit the website of vdpResearch.

Base year

Starting from this edition, the base year for the indices is 2010.

Publication

All vdp real estate price indices are published on a quarterly basis. Each year's first quarter index figures are published on 10 May of the same year (six weeks after the end of the quarter under review). Other publication dates are as follows:

- 10 August, 2nd quarter
- 10 November, 3rd quarter
- 10 February of the following year, 4th quarter (including figures for the year as a whole)

The index figures are released at 8:30 a.m. on the respective publication dates. Where the publication date falls on a Saturday, Sunday or public holiday, the index figures are published on the next working day at 8:30 a.m.

The accompanying press releases are published in German and English on

the websites of the Verband deutscher Pfandbriefbanken e.V. (vdp) www.pfandbrief.de and vdpResearch GmbH www.vdpresearch.de.

The member institutions of the **Association of German Pfandbrief Banks** (Verband deutscher Pfandbriefbanken, vdp) have been the market leaders in commercial real estate finance in Germany and hold sizeable market shares in residential real estate finance as well. As the representative of its member banks, the vdp performs this function vis-à-vis all executive bodies of politics on both the national and the European stage and a wider public.

The vdp's know-how is tailored towards the specific interests of the Pfandbrief issuers, namely, the Pfandbrief business and the underlying business fields property finance, public-sector lending, ship and aircraft finance. The vdp assists its member banks also in regulatory matters and represents them vis-à-vis national regulatory authorities. By means of group governance, member institutions exchange information and experiences in vdp committees, which are then summarized and developed into market standards. The vdp also assists its member banks in the efficient structuring of their specialized loan or issuance businesses.

www.vdpresearch.de

vdpResearch GmbH, a subsidiary of the Association of German Pfandbrief Banks (vdp), works intensively on compiling, analyzing and forecasting property prices in the context of real estate finance. Its remit includes measuring and forecasting trends in rents and prices in the residential and commercial property sectors at the regional and national level.

To measure the movements of rents and prices, vdpResearch makes use of a unique transaction database that is also used to provide property-related comparative prices, comparative rents and other valuation parameters. These parameters are central to specially developed software solutions for valuing standard and individual properties and are fully compliant with regulations governing market and property valuation.

Today, the products and services of vdpResearch are a key component for many credit institutions in the evaluation and assessment of property and market price risks. The nationwide property price indices that vdpResearch prepares for the Association of German Pfandbrief Banks are geared to an interested public and offer an overview of general price trends in Germany's real estate markets.
